RESEARCH INTEREST • Galaxy evolution in the Local Group. • Study of Magellanic System: Circumgalactic medium (CGM) of the Magellanic Clouds, Magellanic Stream, and Leading Arm. • Satellite–host galaxy interactions and environmental effects on low-mass satellites. • Gas and metal distribution in the outskirts of galaxy clusters. • Outflows in broad absorption line (BAL) quasars, including blazar-like BAL subclasses. • Incidence and redshift evolution (dN/dz) of intervening and associated absorption systems. • UV and optical absorption-line spectroscopy as a tool for probing gas flows and galaxy–IGM/CGM interfaces.
